Table S1. Model identifiers as requested and as returned by each provider

The requested identifier is the string sent in the API call; the served identifier is the model field the provider returned in each response, with the number of turns reporting it. Dates are the first and last conversation start dates (UTC).

Table S2. Verification of the reconstructed validator against the application

Twenty-six real model outputs were pasted into the application's result screen on 22 August 2026 and its response recorded; the same texts were then judged by the validator. Sample 04 was pasted while the application held the demonstration package and is reported only for whether fenced JSON parsed. The verdict classes are: accepted; repair prompt (with the clauses the application composed); schema error with no prompt; invalid JSON with no prompt.

Table S3. Whether the rationale for each decision cites a figure from the record

Post hoc analysis over accepted conversations. For each decision row the rationale text was searched for figures with a unit (the same extraction as the citation check) and each figure was checked against the numbers in the package. A change decision is counted as cited when at least one such figure is present in the package. Wilson

95 per cent intervals, with the decision row as the unit, are given for the cited proportion; rows are not independent within a conversation, so the intervals are indicative.

Table S4. How accepted conversations read the package's bolus-only insulin total

Post hoc analysis. The package's treatment_summary gives total_insulin_u 275.95 over 14 days (19.7 U/day), a sum of the bolus and SMB treatment records only: the package carries no basal delivery data, and its scheduled basal profile integrates to 16.2 U/day. Response text was searched for the derived figure (19.7 or 275.95) in a daily total or TDD context, for statements that the total excludes basal or is bolus only, and for a reconstructed total near 36 U/day. Wilson 95 per cent intervals over accepted conversations.

Model	Accepted	Treated 19.7 U as a daily total or TDD, n (per cent; 95 per cent interval)	Noted the total excludes basal, n (per cent)	Reconstructed about 36 U/day, n (per cent)	Lowered max IOB while calling 19.7 a daily total

Table S5. Further package-inherited splits

Post hoc analysis over accepted conversations. Hour of the lows: the package's hourly glucose is keyed both in UTC (time below range peaks at 18.5 per cent at hour 0) and in local time (the same peak at 01:00, BST); responses are classed by where they place the peak, with '00:00 or midnight only' indicating the UTC array read as clock time. Diluted insulin: the record's use of diluted insulin is disclosed only in a free-text profile name inside Profile Switch events; counts give responses mentioning it and responses engaging with its kinetics or absorption. mmol/L: responses quoting the mmol-denominated ISF values from the loop reason strings inside the otherwise mg/dl package.
